

Cooker hood Ciarko & Grenton

This tutorial presents the integration of cooker hood Cirako with Grenton

The presented configuration was performed on:

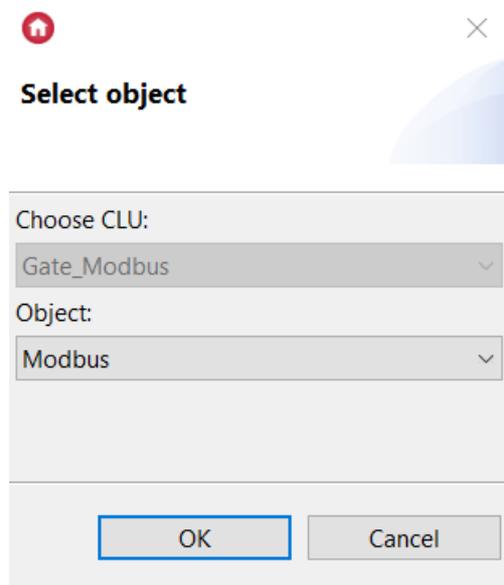

- Object Manager v.1.6.1 (build 221101),
- Gate Modbus 2.0 (FW v1.1.10 (build 2140)) called `Gate_Modbus`,
- Cooker hood Ciarko GT BOX

To integrate Grenton system with cooker hood Cirako, please follow the steps described below:

1. Airflow rate change

Preparing

- Create virtual object `Modbus`

- Enter the name of the object `FanSpeed` and complete embedded features

Object properties

Name: Type:

Id:

Control

Events

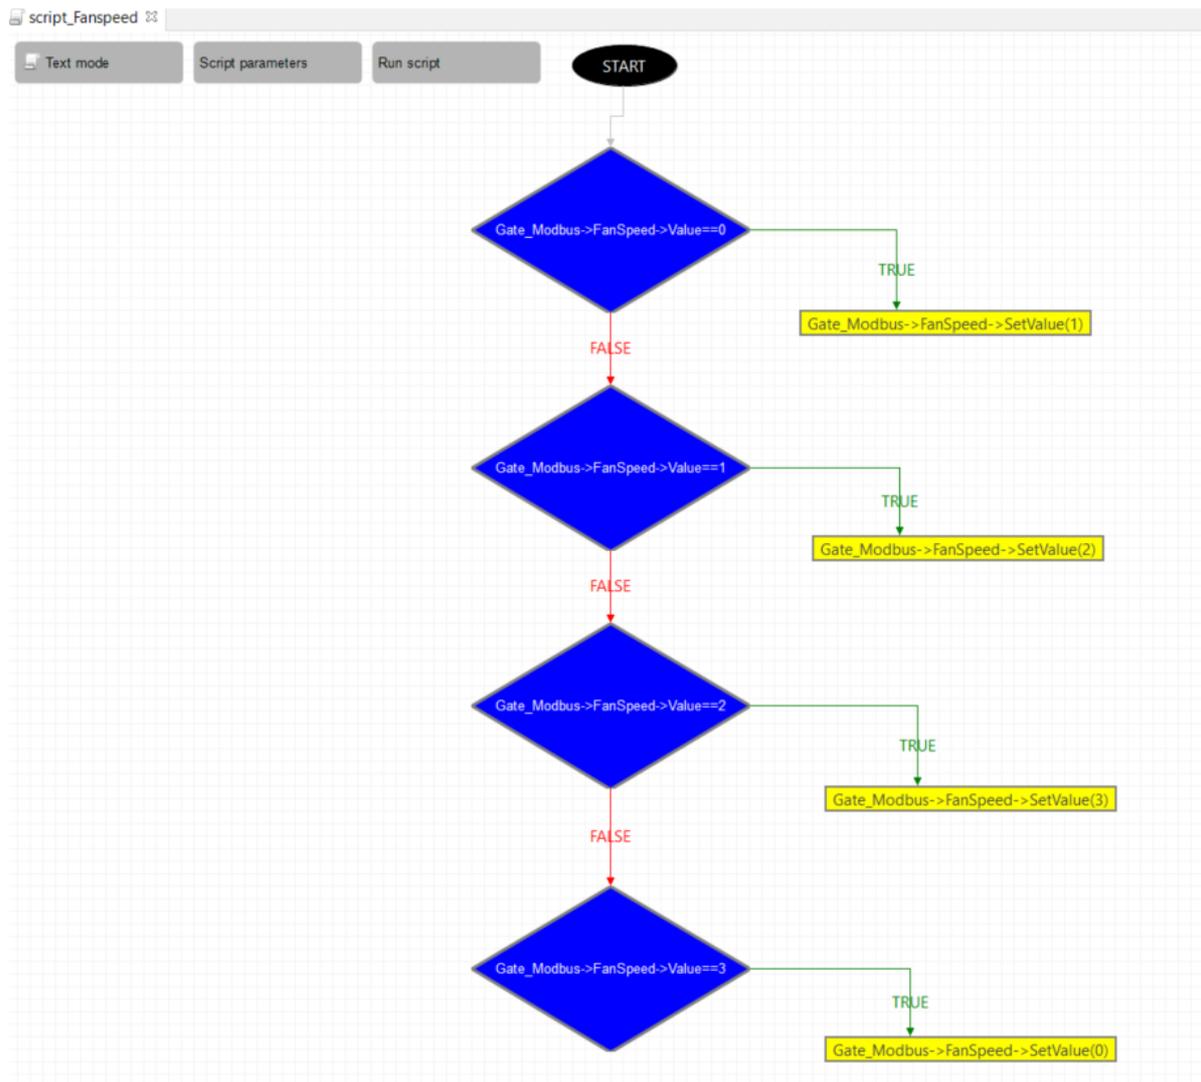

Embedded features

Feature name	Current value	Initial value	Unit	Range
DeviceAddress	64	<input type="text" value="64"/>	number	[0-255]
AccessRights	1	<input type="text" value="ReadWrite"/>	-	0,1
RegisterAddress	0	<input type="text" value="0"/>	number	[0-65535]
TransmissionSpeed	9600	<input type="text" value="9600"/>	bps	1200,2400,4800,9600,192
ValueType	1	<input type="text" value="Number"/>		1,2,3
BitPosition	0	<input type="text" value="0"/>	number	[0-15]
BitCount	16	<input type="text" value="16"/>	number	[1-32]
RefreshInterval	3000	<input type="text" value="3000"/>	number	[0-65535]
ResponseTimeout	2000	<input type="text" value="2000"/>	number	[10-65535]
Divisor	1	<input type="text" value="1"/>	number	[1-65535]
Endianess	0	<input type="text" value="NoSwap"/>	-	0,1,2,3
RegisterType	2	<input type="text" value="HoldingRegisters"/>	-	0,1,2,3
ErrorCode	0		number	
Value	0	<input type="text" value="0"/>	number	
RegisterValue	0		number	
StopBits	0	<input type="text" value="1"/>	-	0,1,2
Parity	0	<input type="text" value="None"/>	-	0,1,2

Auto refresh
 Refresh

```
DeviceAddress - 64
RegisterAddress - 0
```

- Create script `script_Fanspeed` which will allow you to change the speed of the windmill sequentially

text version:

```

if(Gate_Modbus->FanSpeed1->Value==0) then
Gate_Modbus->FanSpeed1->SetValue(1)
else
if(Gate_Modbus->FanSpeed1->Value==1) then
Gate_Modbus->FanSpeed1->SetValue(2)
else
if(Gate_Modbus->FanSpeed1->Value==2) then
Gate_Modbus->FanSpeed1->SetValue(3)
else
if(Gate_Modbus->FanSpeed1->Value==3) then
Gate_Modbus->FanSpeed1->SetValue(0)
end
end
end
end
end

```

- The script can be run in any way, such as a button in the TouchPanel

The screenshot shows the 'Object properties' dialog box for a button object. The fields are as follows:

- Name:
- Device type:
- Id:
- Serial number:
- Type:

Below the fields are several tabs: Control, User schemes, Events, Embedded features, and Statistics. The 'Events' tab is active, showing a table of event names and their assigned commands:

Event name	Assigned commands	Add command
OnValueChanged		
OnSwitchOn		
OnSwitchOff		
OnShortPress		
OnLongPress		
OnHold		
OnClick	<input type="text" value="CLU->script_Light_On_Off()"/>	<input type="button" value="Assign command"/>

Send the configuration to the Gate module

2. Lighting control

Preparing

- Create virtual object

The screenshot shows the 'Select object' dialog box. It has the following fields:

- Choose CLU:
- Object:

At the bottom, there are two buttons: and .

- Enter the name of the object `Light` and complete embedded features

Object properties
